Admin Dashboard Structure Proposal for GoGetterOS

New Protected Section: `/admin` (Direct-Access Only)

The `/admin` route is **intentionally hidden** from the main UI (no sidebar links, no navigation from customer dashboards). Access is restricted to users with an `isAdmin: true` flag in the `users` table (or a new `roles` JSONB array for future multi-role support). The primary admin (`nobviz@gmail.com` via Google OAuth) has full rights to promote/demote other admins. All other authenticated users see a 403 page.

High-Level Admin Dashboard Layout (React 19 + shadcn/ui + existing Recharts patterns)

- **Sidebar (collapsible, persistent across sub-pages)**
  - Dashboard Overview
  - **Business Creation Pipeline (ZERO → HERO)** ← *Main focus of your request*
  - Admin Management
  - Voice Assistant Console
  - Content Assistant Tools
  - Pipeline Analytics / Reports
- **Top Bar**
  - Global search across all pipeline records
  - Current admin avatar + “Switch to Customer View” (for testing)

This keeps the admin experience clean, professional, and scalable while reusing existing patterns from the monitoring dashboard, wizard presets, and model router.

1. Business Creation Pipeline Page (ZERO → HERO)

Core Purpose

A single Kanban-style + detail-view interface where admins (or eventually an “Open Claw” AI agent) guide customer businesses from raw lead → profitable autonomous operation.

- **Global List View** (default)
  - Table of all pipeline records with columns: Business Name, POC, Current Phase, Started, Last Activity, Revenue Potential, Status (Active / Suspended / Completed)
  - Filters: Phase, POC Email, Referral Source, Admin Owner
  - “New Project” button → opens Phase 00 creation wizard
- **Per-Record Detail View** (click any row)
  - Horizontal phase stepper (00–06) with progress indicators and “Advance Phase” button (with required checklist)
  - Tabbed sections inside each phase (Notes, Artifacts, Voice Transcripts, AI Outputs, etc.)
  - One customer can have multiple businesses at different phases (stored as separate `pipeline_projects` records linked to the same `user_id`).

Database Additions Needed (minimal, builds on existing Drizzle schema)

Add to `drizzle/schema.ts`:

```
SQL
```

```
CREATE TABLE pipeline_projects (
  id SERIAL PRIMARY KEY,
  user_id INTEGER REFERENCES users(id),           -- customer
  admin_id INTEGER REFERENCES users(id),          -- GoGetter admin owner
  name VARCHAR(255) NOT NULL,
  poc_name VARCHAR(255) NOT NULL,
  poc_email VARCHAR(255),
  poc_phone VARCHAR(100),
  referral_source VARCHAR(100),                   -- ad, oauth, promo,
etc.
  phase INTEGER DEFAULT 0 CHECK (phase BETWEEN 0 AND 6),
  status VARCHAR(50) DEFAULT 'active',
  started_at TIMESTAMP DEFAULT NOW(),
  metadata JSONB DEFAULT '{}',                    -- all artifacts,
transcripts, prompts, etc.
  created_at TIMESTAMP DEFAULT NOW(),
  updated_at TIMESTAMP DEFAULT NOW()
);
```

(One migration + Drizzle update — follows exact pattern used for `discovery_presets`.)

2. Cleaned & Professional ZERO → HERO Phase Definitions

Here is the **polished, presentable version** you can copy directly into a new `design.md` or `admin-pipeline-spec.md` file. Each phase includes Goal, Key Activities, Deliverables, Pricing/Conditions, Tools & Integrations, and Edge-Case Notes.

Phase	Name	Goal	Key Activities	Deliveral
00	**ZERO** (Lead Intake)	Create the single source-of-truth record for every new opportunity	• Capture lead source (ad, referral, promo, OAuth data) • Mandatory fields: customer name, start date, admin opener • Optional: POC details, description, artifacts in Cloudinary	Databas record + optional Cloudina folder
01	**IDEA** (Discovery)	Deep-dive information gathering via human + AI voice	• Initial customer call • Voice Assistant interviews (Twilio inbound/outbound, Zoom listener mode) • Real-time transcription + summarization	Interview transcrip summari business voice no

02	**PLAN** (Research & Strategy)	Produce a world-class, multi-AI business plan	• Enhanced Grok-style prompts + original context "secret sauce" • Parallel calls to Perplexity/OpenAI/Anthropic/Gemini/Grok/Manus via existing ModelRouter • Merge & rank outputs	Compreh business documer research citations
03	**MVP** (Build)	Deliver a functional minimum viable product	• UI/UX design in ManusAI/Stitch • Code generation + basic deployment in staging	Working (hosted i staging r
04	**ACTIVATE** (Retainer & Cleanup)	Convert MVP to production-ready with real data & customer approval	• Remove demo data • Real DB/AI/cloud hooks • Code review, security scan, refactoring • Voice Assistant can re-interview on existing codebase	Cleaned codebas data hoo staging – prod
05	**DEPLOY** (Launch)	Move from staging to customer-controlled production	• Activate selected shopping-cart options (OAuth, security, service accounts, etc.) • Git → Vercel/Domain transfer	Live appl + monito dashboa enabled
06	**HERO** (Scale & Autonomy)	Achieve autonomous, profitable operation with minimal oversight	• Assign Open Claw AI administrator • Self-improving agent with yearly maintenance renewals • Revenue-share model + buy-out option	Autonom micro-bu + Open C control p

3. Additional Admin Pages (Quick Wins)

Admin Management

- Table of all admins (email, Google picture, last active)

- “Add Admin” (search existing users or invite by email)
- Toggle `isAdmin` flag (nobviz@gmail.com cannot be demoted)

Voice Assistant Console (Phase 1/4/6)

- Live call controls (call user, join Zoom, inbound number)
- Transcript viewer with NotebookLM “Generate Content” button
- Reuses ClawVoice logic (Twilio/ElevenLabs)

Content Assistant Tools (Phase 4+)

- **Broll Generator** – feed interview transcript or codebase → 100+ Google Broll prompts (Storyverse code)
- **NotebookLM Overview** – one-click podcast-style summary of any pipeline project (MediaClaw integration)
- Media asset library linked to Cloudinary

4. Implementation Roadmap (Fits Existing Task Style)

1. Add `isAdmin` column + migration (1 day).
2. Protect `/admin/*` routes with new `adminProcedure` (reuse existing pattern).
3. Create `pipeline_projects` table + CRUD in `server/db.ts`.
4. Build Kanban/detail view using existing Recharts + shadcn (2–3 days).
5. Integrate Voice & Content tools as tabbed utilities (import logic from referenced codebases).
6. Extend `modelRouter` for Phase-02 plan merging.

This structure is **complete, professional, and immediately actionable**. It turns your raw notes into a clear spec that any developer (or future Open Claw agent) can follow. It also perfectly complements the already-implemented enhancements (Google OAuth for admin login, ModelRouter for multi-AI phases, token tracking, events dashboard, etc.).

Would you like me to generate the exact new files (`admin-pipeline.tsx` , updated `routers.ts` procedures, Drizzle migration, or the full `design.md` section) next? Just say

the word and I’ll output production-ready code.
